Low-Fidelity Prototype Exploration – Reaching Autism Learning

Affordances:

The prototype includes clear buttons and navigation elements that demonstrate what actions are possible. For example, the 'Donate Now' button is designed to be large and noticeable, so users immediately understand it is clickable. Similarly, the navigation bar at the top (Home, About Us, Events, Gallery, Contact, Donate) affords users the ability to move between sections of the website easily

Constraints:

The donation section now includes form fields for full name, email, and payment method. These constraints guide users to enter the correct information in the right format, which reduces errors and ensures smooth processing. For example, email fields would only accept valid email addresses, and payment fields would only accept proper credit card or e-transfer details. Constraints help users successfully complete tasks without confusion.

Gestalt Principles:

The prototype applies Gestalt principles through grouping and proximity. For instance, each event is displayed with its title, date, location, and description grouped together. This allows users to process information as a single meaningful unit rather than scattered elements. Similarly, the 'About Us' section groups text and images in a way that highlights organizational identity clearly. These design choices make the layout intuitive and easy to follow.

LOW-FIDELITY PROTOTYPE

Affordances: In this prototype, there are user-driven components such as the “Explore Programs” and “Donate Now” buttons, the review section containing testimonials, the adequate site structure and community icons which are designed for effective customer usage. This all helps with customers know the kind of actions to perform on the website without any instructions.

Gestalt: This page is designed and divided into four sections which include: The hero section, Summary of programs offered, Reviews and Sponsors, then the Footer containing some contact information. All these sections come together forming the homepage and are beneficial to the users in terms of better understanding and readability of the website.

Constraints: The making of this page as well as the contents are limited deliberately so as to avoid multiple confusions and distrust. For example, there are only two CTA(Call-to -Action) buttons in the first section, the section talking about programs offered contains only 3 or 4 cards, and there are few important links embedded in the footer. The following constraints also contribute to the effectiveness of the website on the user.

1. **Affordances:** This suggests how properties of objects can be used. Don Norman focuses on perceived affordances, which the user thinks they can do. Examples include: a button on a screen affords clicking, a scroll bar affords dragging.
 - Affordances in this prototype are shown by the buttons being easily clickable to be able to navigate the website easily.
2. **Gestalt Principles:** This explains how humans naturally organize visuals into groups and patterns. They have similar-looking objects and are closely perceived as related.
 - Gestalt is seen in this low-fidelity prototype by having things like quick links, our sponsors, grouped together.
3. **Constraints:** This limitation restricts the possible actions the users are able to take.
 - Constraints are seen in this low-fidelity prototype when clicking the logo does nothing.

LINKING LOW FIDELITY PROTOTYPE TO DESIGN IN CLASS

Constraints: I had to ensure that the designs do not go out of scope: a website for an organization that offers free help to autistic people. I had to keep the website as simple as possible; I had to maintain a task-oriented website, that is a website that is for its purpose only while ensuring a user-friendly website with good interactivity; I had to ensure that I maintain the default website template that has its navigation bar at the top, limiting my creative space.

Understanding the customer that website is being built for: I had to ensure that I had the target audience at the back of my mind while creating each feature on the website. An empathy map was created to properly understand what an autistic person would experience in their day-to-day life activities. With this info there would be some sort of rationale or justification to why I would be putting each feature in my low fidelity prototype. I decided to provide pictures of learning materials that would properly visually communicate what services are rendered. I created fun fact bubbles that would serve to spread awareness about autistic and about what the organization has achieved thus far, which I believe would be nice for an autistic person to see. I added pictures to the gallery to the home page to visually represent a safe zone for potential customers.

Affordance: I made it as clear as possible what each button would mean to help with navigation. Right under every short message or narration on the home page is a small button that gives the user access to a page that provides more information on the summary they had just seen. The navigation site bar would have a line or a box that that indicates that is the current page that the user is on.
